

# ERA Assist

## Automated Data Collection and Validation

# RME6 ERA Assist

**ResearchMaster's ERA Assist** is designed to help you collect and collate data for the Excellence in Research for Australia (ERA) submission. It automatically identifies eligible researchers and their research outputs based on the business rules and format defined by Australian Research Council (ARC).

ResearchMaster has consistently provided ERA software solutions and support to assist our clients in their successful submissions since the very first ERA collection in 2010.

## Track eligible researchers and research outputs

ERA Assist identifies researchers and research outputs that are eligible for each ERA submission based on the ARC guidelines for the current ERA submission.

## Easily setup and configure ERA rounds

Administrators can easily setup new ERA rounds both official and internal. Edit, define and manage the portfolio details for each round and export these into a CSV file. Details of previous ERA rounds can also be maintained.

## Embedded in RME6

Eliminate double data entry and capitalise on existing security, user access and reports. Utilise the collection purpose in RME6 to identify which collection the research output is going to be submitted for.

## Match records to ARC and Scopus

Import the ARC journal list and match them against your existing journals. Send indexed journals to Scopus then import the Scopus IDs.

## User-friendly edit functionality

ERA Assist allows you to 'slice and dice' ERA information at the individual, cluster and panel levels. The user-friendly interface also allows you to easily identify and correct data errors.

## Validate Business Rules and XML Generation

ERA Assist validates the available RME6 data against the ARC submission requirements and issues alerts if any required information is missing. Once corrected the XML file can then be generated for ERA submission.
